

September 16, 2026
Week 2 Meetings notes

TODO:

- Make Github
- Find different sources of data that we can narrow down further
 - Look at previous online projects that create datasets of social media using text tones
 - Ex. text tone data specifically
 - Put your sources here:
<https://docs.google.com/document/d/1n0MX1NhRGEBC4v-xV07BBiMuaPik3odNZiDHsc1bK1I/edit?usp=sharing>
- Speak with TA tomorrow (Sept 17 1:30pm) and professor on Monday (Sept 21 9:30am)
- Create a pdf for submission
<https://docs.google.com/document/d/1HCTyDybbu0i3CkSl9r-pMDG5XEBIt02YTnn90SDHpbM/edit?tab=t.0>
- Initial pitch/deliverable_0
- Manav and Aditya to look into how we get the site data for the web extension (look for papers)

Notes:

- Gathering data
 - Can annotate our own data from existing data
 - Concerns about biasing data by picking and choosing data
 - Start with reddit (potentially X)
 - Link together posts that have shared context (Ex. comments under a thread)
 - Can start simple (scrape sarcasm tone data) then build with more complicated tones (ex. Emojis)
 - multiple tones? if our data is all trained on classification to one tone how do we account for if we have multiple tones need to find data to train on multiple tones maybe?
 - comment replying to another comment? lets say we have a sarcastic thread? we would need the context of the previous messages for data scraping even to classify properly.
 - Comments/sentences can be vague and hard to assign a tone to that
- Data parsing
 - Have a link to a parent post
- Determine personality of author of posts?
 - Could be complicated/extensive
- User Functionality for extension
 - Button on reddit (or other social media platform) to prompt the user for tone meaning
 - Extension overlays the text to show the user what the tone would be

- Possible visualization of tones through a sentence of text
- Possible percentage breakdown of how accurate/"sure" our model is
- Meeting structure
 - Full team meetings during class times
 - Meet with specific people collaborating on specific tasks

Possible data sources:

- <https://huggingface.co/datasets/uhoui/text-tone-classifier>
- [Social Media Sentiments Analysis Dataset | Kaggle](#)
- https://github.com/google-research/google-research/blob/master/goemotions/data/full_dataset/README....
- [YouTube Comments Sentiment Dataset | Kaggle](#)
- Reddit scraper: https://www.reddit.com/r/web scraping/comments/1kjwz0c/opensource_reddit_scraper/
- This site has scraped 1.3 million reddit comments tagged with /s: <https://www.kaggle.com/datasets/danofer/sarcasm?resource=download&select=test-unbalanced.csv>
- We can query the Pushshift or AsyncPRAW APIs to search for comments ending in "/j" etc across specific subreddits.

Additional Context info about project:

- Information about tone indicators: <https://toneindicators.carrd.co/#masterlist>

Plans for data collection:

- Get pre labelled data set for each tone
- Find a community that uses a lot of tone indicators and web scrape
- Annotate our own data 🙄💔

tone indicator	meaning
/j	joking
/hj	half-joking
/s	sarcastic
/gen or /g	genuine
/srs	serious

- lh - light hearted?
- pos/neg?

- Some online sources include positive/negative connotation without tone indicators- we could possibly use this?

What we need to submit for the 21st professor instructions from the slides:

Team/Project
form (submit
individually,
all students)

- Use the posted form
- Description
 - The description should make it clear that the project will involve significant software design/development activities. The scope and complexity of the work should be appropriate for a team of 5 to 7 students, each working an average of 10 hours per week.
- **Members of the same team: Please submit identical PDF files with the same file name for project / team form.**
- **For future submission, you will submit per team**
- At a minimum, we will look for the following:
 - **Why** this is worth doing? What is the purpose? Who are the stakeholders?
 - **What** is the expected functionality (high level features, at this stage we don't need formal requirements). Is there a front end and a backend? Is this a web-based system or app or none of the above? Do you have ML?
 - **How** will you go about building it? What are the tools/programming languages/product management systems you expect to use? Do you need data? Do you have the data or a reliable plan to get data?
