We can go over like P0-P3 things?

- **P0 (Must Have):** Core Critical MVP. The project cannot be considered functional without these.
 - Model needs to Identify Claim, Evidence argument components and the relation -> between pairs Support, Attack, Neither
 - Claim to be identified through the headline of the article (should be in support or against the main topic in the article)
 - Relationship between claim and evidence needs to be extracted,
 - Using article headline to identify claim? or have model go through article body and identify the main claim?
 -
 - Visualizing the claim and evidence in the web extension
 - Web extension where the our information from the model is displayed
- **P1 (High Priority):** Target release requirements for the final system.
 - Identify information disorder (malinformation, disinformation, misinformation) using our results -> should we move this up to P0?
 - Catch the malicious intent (if it exists in the article)
 - Add Backing to argumentation scheme
- **P2 (Medium Priority):** Desirable extensions if time permits.
 - Text-highlighting, UX friendly indicators of evidence in claims (ex. Supported evidence is highlighted in green)
 - Relationship extraction between claims as well?
- **P3 (Low Priority):** Stretch goals or futuristic additions.
 - For each requirement, specify the input, expected output, data flow, and whether the requirement is primarily frontend or backend focused.
 -

What should our model output?

Argument Components: Claim, Evidence

Backing? should we start with just Claim and Evidence or is that not complex enough?

Relations: Support, Attack, None

- Stages of model output (start with claim and evidence, then refine later)
- Find claims

How are we incorporating information disorder into this? Classifying the article as misinformation, malinformation etc goes on top ? Another part of the NLP pipeline?

NLP pipeline? Argument component Classification -> Relation classification -> Information Disorder classification? or?

What do we want the user to see when they use the extension?

- User has a window in their browser that pops up when the extension is clicked
-
