

Agenda:

[NOTES FROM DR.LAHANALA MEETING](#)

- We should get our SRS doc reviewed by TAs
 - Draft of some sort
- Where's everyone at with the SRS document... 🙄
- Finalize our P0-P4

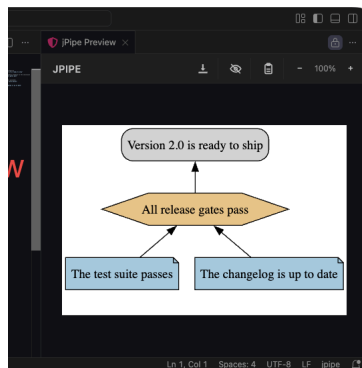

main takeaway?

Goal is Media Literacy for user. Priority is having our model accurately display the Argumentation structure of the article (Identifying Claim and Premises components + which relationship like if the premise/evidence is supporting or attacking the claim). But important to flag to user that just because a claim has a supporting premise doesn't mean the claim is true -> our tool initially can suggest queries etc for the user to search/look more into sort of thing?

For information disorder the classifying as malinformation, misinformation, disinformation we initially can just have some sort of description so the user knows what the three types of information disorder mean -> implementing AI classification of the three types can be a later extension?

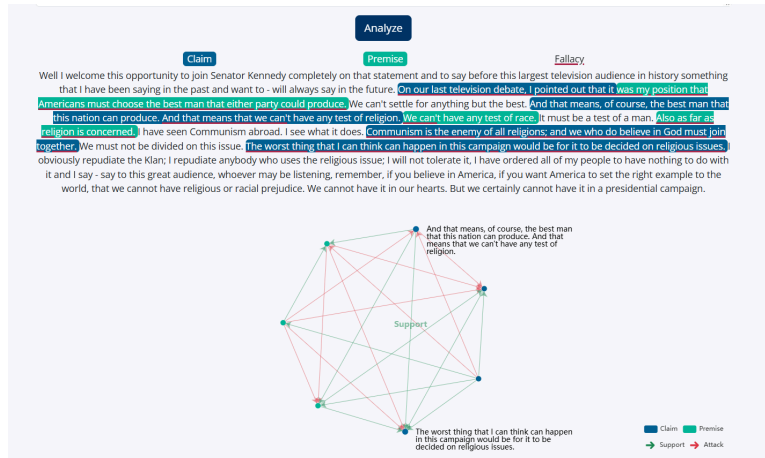

<https://www.jpipe.org/tutorials/jpipe101/>

^^^jpipe format can be P0?

<https://3ia-demos.inria.fr/disputool/test-model/>

^^something more like this can be p1/p2? ->like more user friendly/interactive

More questions lol:

- Are we identifying the major claim of the article by headline?
- What if the article has multiple claims in it should we identify those as well? Like subclaims? Or start with just identifying the major claim

Example:

Claim: Y = The government should ban pumpkin pie (idk sorry 🥲🙄)

Premise 1: X1= recent studies show pumpkin pie causes long term memory loss in 36.3% of consumers after 10 years

Premise 2: X2 = pumpkin pie creates joy

What our model would output: X1 -> supports Y
X2 -> attacks Y
