

Notes:

- Areas that the project touches:
- Information disorder, three type:
 - malfinformation, - based on reality inflicts harm
 - disinformation, and
 - misinformation
- Application that the user takes in news article? Where claims are being made and make a visual representation of the arguments themselves
- Promotes media literacy
- Toulmin model for argumentation

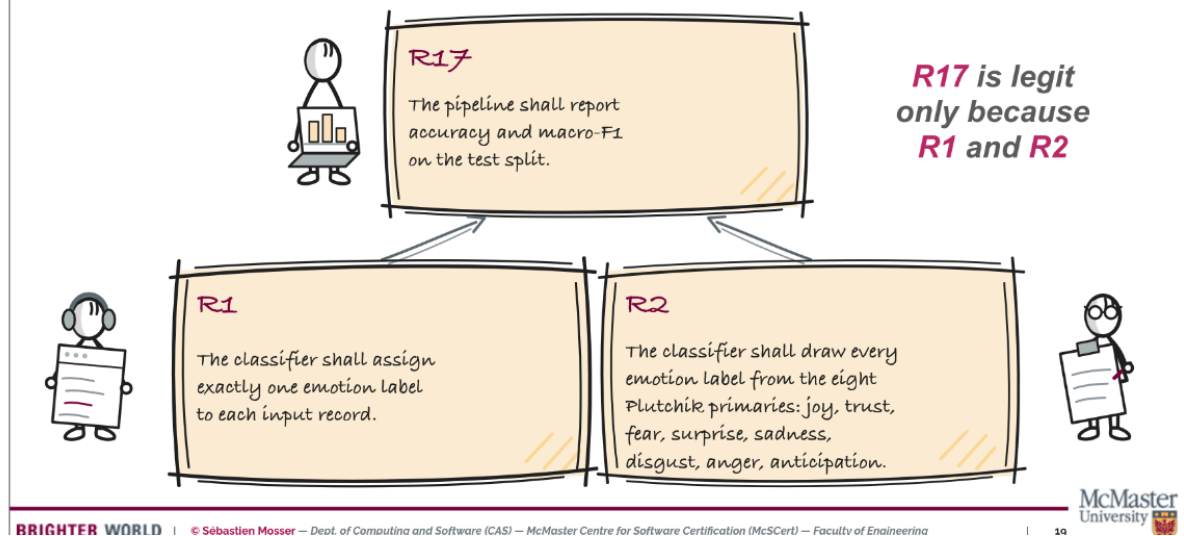

DIAGRAM OF THE TOULMIN ARGUMENT MODEL

- Framework for analyzing and constructing arguments
- Claim: Main point or conclusion
- grounds : evidence/data facts to support (e.g. clinical trial)
- Warrant: logical connection why data supports claim (often implicit)
- Backing: additional support for warrant
- Qualifier: how strong the claim is being made
- Rebuttal: acknowledge and circumstances
- The main appeal is very emotional
- Media is never clean as examples
 - Grounds might not be there, warrant might not be there

- Make intelligent systems to find what “in order for this to be true....” “this evidence would help...”
- **Seb mosser jPipe tool**, place of req eng if you are expecting a system to be deployed
what are the safety reqs, what needs to be put in place
https://github.com/jpipe-mcscert/tutorial-re-2026/blob/main/slides/jPipe_RE_1.pdf

High-level requirements & Dependencies

- Combine multiple areas of research
 - Fake news (info disorder)
 - Arg parsing
 - Domain transfer?
- Scope is very broad, we can make it more specific e.g. scientific articles
-

Why this is worth doing?

What is the purpose?

Who are the stakeholders?

What is the expected functionality (high level features, at this stage we don't need formal requirements).

Is there a front end and a backend?

What are the tools/programming languages?

Is this a web-based system or app or none of the above?

Do you have ML?

How will you go about building it?

What are the tools/programming languages/product management systems you expect to use (note that the professor mentioned the tech stack is very flexible not set in stone)? Do you have the data or a reliable plan to get data?
