

Meeting Notes

- ML Model
 - Argument parsing may not be able to classify all specific parts of Toulmin's model
 - Start with identifying claim and premise, attack support relations, and visualizing it using JPipe as a base
 - Maybe later in the project, identify more implicit components (such as warrant or backing)
 - Priority 0 is defining the argumentative structure of the article -> goal is help user with **media literacy**.
 - i.e For our initial model we can start with like identifying a claim and that this premise attacks/supports the claim but the premise/evidence itself is not yet fact-checked but can generate a suggestion query for the user to use to do the fact-checking
 - In order to prove our evidence is valid (ground truth), could add fact-checking functionality
 - This could be a feature added later
 - Could possibly query a search engine using an API to help the user with this research
 - Suggest queries to educate the user on further research to validate their claim
 - We need some sort of remedy to educate the user if the evidence is valid or not
 - Natural Language Inference
 - Information Disorder
 - Distinguishing all types of information disorder might be a lower priority task- main focus of detecting if a claim is valid may be better
 - Would need to do further research in classifying different types of information disorder, and if this would be helpful for the user
 - Dataset training
 - Dr. Lahnala recommended this [training paper](#) in deciding where to start training model
 -
